

In light of recent publicity surrounding the threat to home security through the method of lock snapping, the Association of Composite Door Manufacturers has prepared a statement to guide consumers in the most effective methods of improving home security.

The lock attack MO that has been highlighted in recent media activity exploits one specific vulnerability of certain types of locking mechanisms. A number of retro fit solutions are available in the market, aimed at addressing this element of external door security. If this retro fit route is chosen then use a reputable locksmith and ensure that the retrofit package is compliant with the GGF/DHF TS007 document. The most thorough method of upgrading the security of your home is to specify certified PAS 24 door sets, specifically those that carry third party certification.

PAS 24 is a security performance standard that addresses the security of all aspects of the complete door set, including locking systems, hinges, glazing and the strength and resistance to attack of the door leaf and frame. Specific test methods to address this specific lock vulnerability have been included within PAS 24 since 2007. Therefore, more than half a decade, the Association of Composite Door Manufacturers members have been providing complete door sets that resist snapping, and all other methods of attack, employed by opportunist burglars,
